Molecular Markers In Endometrial Cancer : Pathogenesis,Prognostication and Practices

Saturday, 3 October 2020 19:05 (10 minutes)

Dualistic classification for endometrial carcinoma by Bokhman is traditionally followed.This yields limited prognostic and predictive information. The breakthrough with TCGA (the Cancer Genome Atlas classification) provided a more reproducible,objective and has given a diverse genomic insight into the heterogeneity of the Endometrial cancer. Methods: This review looks into the practices to incorporate the molecular classification into the traditional classification system.Conclusion:Integerated molecular classification with some limitations enhaces the risk stratification and thus prognosticate endometrial carcinoma.This will help in delivering a more objective and individualised patient care.
