Multiple Endocrinopathies in Pregnancy:She sailed through! A case report

The presence of multiple endocrinopathies in pregnancy is a rare occurrence. It throws a significant challenge- beginning from conception, through the antenatal, during parturition and beyond. An intervening infection or an unexpected complication of the existing endocrinopathies further adds threats to the delicate situation.

Prompt recognition, early initiation of therapy, close monitoring and follow-up with multidisciplinary care are indispensable in order to achieve a successful outcome.

We present the case of a patient with pituitary adenoma, adrenal insufficiency, and hypothyroidism, of how she sailed through the diagnosis and management and walked home with a healthy baby.
